NEW CONSTRUCTION TECHNIQUE FOR
MAXIMUM PYRAMID ENERGY

By Dean and Mary Hardy

The Cheops Pyramid is an electromagnetic antenna designed to expand the human consciousness. The actual construction of the pyramid is one of the most crucial components in maximizing the generation of sub-atomic or pyramid energy. We have developed a process to increase the power of this antenna. In July of 1975 we went to Kenneth Killick in Stittsville, P. Ontario, Canada. He designed for us a new process called the "capacitance film construction method." This method for building pyramids has never been used before in this time continuum. The pyramids that we build are constructed like a capacitor. Because of this unique construction, a large vortex is created within the pyramid. It is in this vortex that the two directions of light are combined. Pyramid means, "light in the middle." These pyramids refocus light into its sub-atom particles of electrons and protons and combines the two directional spin of the atom into one big electromagnetically balanced vortex. It is in this vortex that the power of the pyramid exists. A frame pyramid will not generate the vortex.

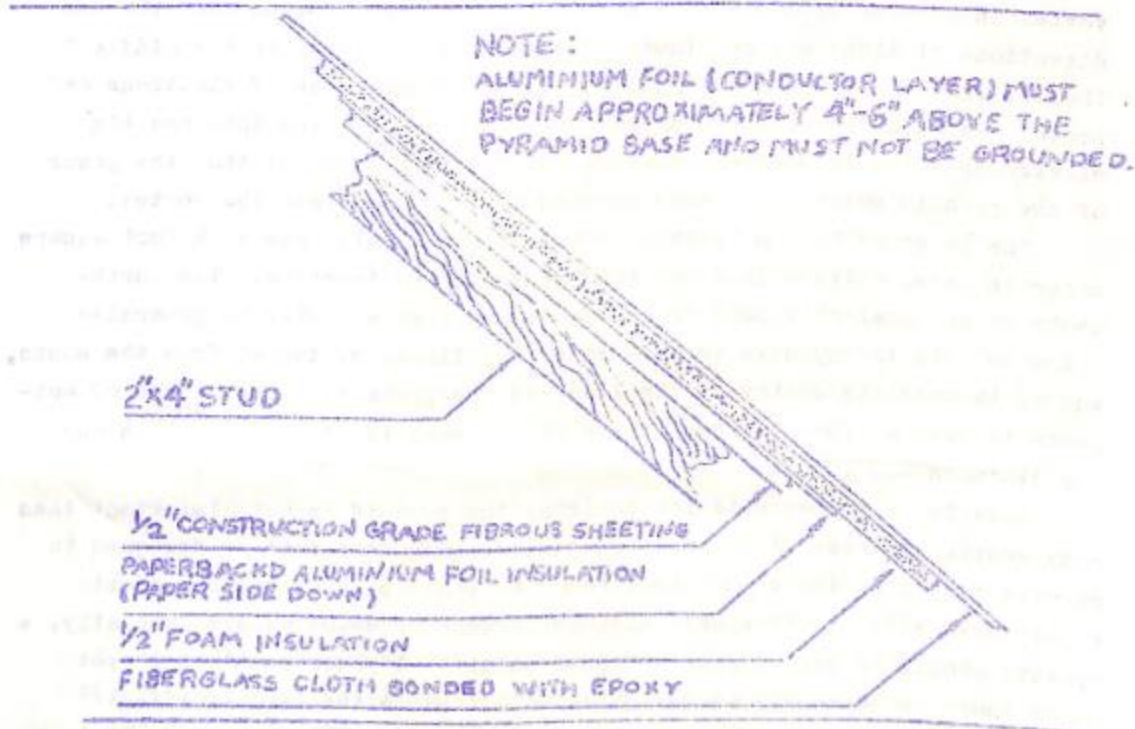

The backyard Cheops Pyramid, which we have built, has a 24 foot square concrete base, aligned in a magnetic north-south direction. The north-south directional alignment is not necessary when a vortex is generated. Entrance into the pyramid is made under the floor, by tunnel from the south, and up through the center of the floor in the pyramid. This method of entrance is used so that the continuity of the wall is not broken or in any way disturbs the vortex.

Locating a proper site for building the pyramid is more important than many people believe. A pyramid is an electromagnetic antenna designed to receive light; if there is interference it won't pick up the sub-atomic light very well. Avoid electrical interference or dense metals. Ideally, a pyramid should be placed over a 'power point!' A power point is a spot where there is an energy vortex which will enhance the pyramid effect. Perhaps it's like acupuncture points on the face of the earth. Dowsing techniques can be used to locate such points.

The pyramid is approximately 15 feet high and is built to the scale of the Cheops Pyramid, the Great Pyramid of Giza. The pyramid is attached to

the concrete pad with steel lag bolts. This is the only place where steel, or ferrous materials, may be used in the construction of the pyramid. After the pyramid is once completed, magnetic or ferrous materials should never be brought into the pyramid above the ground (or base) level, since they cause a distortion in the vortex. However, the vortex or pyramid energy, will regenerate itself as soon as the magnetic materials are removed.

The sides of the pyramid are constructed by what is referred to as the "capacitance film construction method," which consists of layers of aluminium and paper, also called the laminated method. You will note from the drawing that the laminated method of construction from the inside the pyramid to the outside is as follows: First, a frame-work of wood, which in larger pyramids would normally be 2x4's, then an insulator, then a conductor, then an insulator. In some cases, additional layers of conductor(s) and insulator(s) may be desirable.

The insulators must consist of solid wood (not plywood) and/or fibrous sheeting, and/or styrofoam sheets, and/or fiber glass impregnated with poly resin. The fiber glass is also an excellent outside skin for protection against the weather.

The conductor must be of aluminum foil or any other nonferrous conductive film or wire mesh screen. There must never be a break in the conductor and there must never be any contact between alternate layers of conductors or insulators. In addition, all conductor layers should begin approximately 4-6 inches above the base of the pyramid.

Use only aluminum nails, or any nonferrous nails, in the construction of the pyramid; however, remember that there must be no breaks in the aluminum foil or mesh and that there must be no electrical short between any two layers of materials. Each succeeding layer may be attached by glue or some type of nonconductive mastic tape.

In the center of the pyramid is an adjustable platform that can be adjusted to the different chakras. This way a person can focus the central point of energy on any part of the body he or she wishes to heal or develop.

We now have two models of pyramids that we have prints for. The larger backyard model prints sell for \$20.00, a 15-page booklet of blueprints that tells you how to build this special pyramid. It can be adapted for any size of pyramid. The smaller pack-up-and-go pyramid prints sell for \$8.00 and are in a 5-page booklet. The pack-up-and-go pyramid is a strong antenna and it can be used inside. It will pack up to a storage size of 4 feet by 4 feet and 6 inches tall.

The pack-up-and-go pyramid is designed for people on the move or people who have limited space. The materials for this antenna can be purchased for about \$40.00. All of the materials can be purchased at the local lumber company. Do not use a water soluble glue to paste the layers together. You are constructing a capacitor and if the water does not dry between the layers you will lose the capacitance effect and a vortex will not be generated.

What we recommend to paste the layers together is a good foundation waterproofing solution of black tar, also called "Bear Shit." This also acts as a dielectric and forms a good layer of non-conductive material between the layers. It dries quickly and the five layers can be put together in one day. White gas is recommended to thin the tar down and to clean up the mess.

Again, the pack-up-and-go pyramid is an electromagnetic antenna. If it is used near a T.V. or other electrical disturbance the vortex will be disrupted. No ferrous or magnetic clothing or jewelry can be worn in the pyramid. We are dealing with light. One does not go to the beach in a winter coat to get a suntan. The more one exposes his or her body to the light, the better the reception will be.

Over

person is very interested in researching energy generated by the pyramid. We hope that many people will build this large backyard pyramid so we can have a research center and share our knowledge and experiences with each other. We are dealing with a sub-atomic energy that has been used for years to expand the mind. We believe the Choeps was originally built as a temple of initiation into the higher levels of consciousness. With the help of this tool man can discover the kingdom of God that is within himself. We thank the designer of this pyramid, Kenneth Killick. One must understand the electromagnetic field of the aura to be able to design this kind of antenna. We feel that there are few people who have this knowledge. This is the reason we have chosen this man to be our teacher and pyramid designer.

When and if you plan to build a pyramid, please send us a photograph of the area and describe how deep the water table is in the area you plan to build on. When a pyramid like the Choeps is built, it is important to know how far the water table is below. Look at the diagram to understand what happens, "As above; so below." The pyramid is a doorway to different levels of consciousness. It is the starting point to expand into the ether or shrink into a molecule of matter.

NEW CONSTRUCTION TECHNIQUE FOR
MAXIMUM PYRAMID ENERGY

By Dean Hardy

The Cheops pyramid is an antenna designed to expand the human consciousness. It is my belief that the actual construction of the pyramid is one of the most crucial components in maximizing the generation of sub-atomic or pyramid energy. What I have done is developed a process to increase the power of this antenna.

The pyramid, which I have built, has a 24 foot square concrete base, aligned in a magnetic north-south direction. Entrance into the pyramid is made under the floor, by tunnel from the south, and up through the center of the floor in the pyramid. This method of entrance is used so that the continuity of the wall is not broken or in any way disturbed.

The pyramid is approximately 15 feet high and is built to the scale of the Cheops Pyramid, the Great Pyramid of Giza. The pyramid is attached to the concrete pad with steel lag bolts. This is the only place where steel, or ferrous materials, may be used in the construction of the pyramid. After the pyramid is once completed, ferrous materials should never be brought into the pyramid above the ground (or base) level. This also includes items of clothing and/or jewelry.

The sides of the pyramid are constructed by what is referred to as the laminated method. You will note from the drawing that the laminated method of construction from the inside the pyramid to the outside is as follows: First, a frame-work of wood, which in larger pyramids would normally be 2x4's, then an insulator, then a conductor, then a insulator. In some cases, additional layers or conductor(s) and insulator(s) may be desirable.

The insulators must consist of solid wood (not plywood) and/or fibrous sheeting, and/or styrofoam sheets, and/or fiber glass impregnated with poly resin. The fiber glass is also an excellent outside skin for protection against the weather.

The conductor must be of paper backed aluminum foil or any other nonferrous conductive film or wire mesh screen. There must never be a break in the conductor and there must never be any contact between alternate layers of conductors or insulators. In addition, all conductor layers should begin approximately 4-6 inches above the base of the pyramid.

Use only aluminum nails, or any nonferrous nails, in the construction of the pyramid; however, remember that there must be no breaks in the aluminum foil or mesh and that there must be no electrical short between any two layers of materials. Each succeeding layer may be attached by glue or some type of nonconductive mastic tape.

Locating a proper site is more important than many people believe. A pyramid is an antenna designed to receive light; if there is interference it won't pick up the sub-atomic light very well. Avoid electrical interference or dense metals. Ideally, a pyramid should be placed over a 'power point.' A power point is a spot where there is an energy vortex which will enhance the pyramid effect. Perhaps it's like acupuncture points on the face of the earth. Dowsing techniques can be used to locate such points.

In the center of the pyramid is an adjustable platform that can be adjusted to the different chakras. This way a person can focus the central point of energy on any part of the body he wishes to heal or develop.

I have printed up a 15 page booklet of blueprints that tells you how to build this special pyramid. It can be adapted for any size of pyramid.

I am also interested in researching this energy. What I hope is that many people will build this large backyard pyramid. Then we can form a research center and share our knowledge and experiences with each other. What we are dealing with is a sub-atomic energy that has been used for years to expand the mind. I believe the Cheops was originally built as a temple of initiation into the higher levels of consciousness. With the help of this tool man can discover the kingdom of God that is within himself.
